

Graceful degradation: runtime integrity vs number of components removed

Mean and worst case (minimum) RIS over every configuration with that many components removed. Individual configurations shown as dots.

Degradation is monotone but NOT linear: the first removal already costs up to 0.67 RIS in the worst case, because a single evidence-plane removal takes the ledger, hash-chain and replay planes down with it.
Note: no configuration in the ablation matrix removes exactly 4 component(s), so that abscissa has no data and the lines interpolate across it.
