

Runtime integrity score by configuration (sorted)

RIS = mean of six health planes (detection, revocation, evidence, ledger, hash-chain, replay), normalised so the intact baseline scores 1.00.

Bars are coloured by the experiment's own overall runtime verdict.

RIS is audit-weighted by construction: four of the six planes are audit/provenance planes, so a purely security-degrading ablation (e.g. removing revocation) costs less RIS than an evidence-plane ablation. The verdict colour, not the bar length alone, carries the security interpretation.
